

## Module 02 - Linear Functions

*Introduction for Module 2 - Linear Functions.*

The first type of function we will look at are Linear functions. These are functions with a **constant** slope. By the end of this Module, you should be able to:

- Describe the three types of linear functions;
- Describe what is needed to construct a linear function;
- Transition between a linear function and the graph of a linear function;
- Transition between different forms of a linear functions; and
- Solve linear equations with integer or rational coefficients.

---

Learning outcomes: Recognize and construct linear functions as well as solve linear equations.
